

**INSPECTION METHOD FOR ARRAY SUBSTRATE
AND INSPECTION DEVICE FOR THE SAME**

5

ABSTRACT OF THE DISCLOSURE

Disclosed are an inspection method for a disconnection of a storage capacitor
line and an inspection device for the same in an inspection of an array substrate used in
10 a liquid crystal display apparatus. An inspection method for an array substrate is
constituted, in which a quantity of charges stored in the storage capacitor becomes C
($V_{d1}-V_{cs1}$) by supplying simultaneously a pulse signal V_d and a pulse signal V_{cs} to the
storage capacitor from a signal line and a C_s line on a TFT array substrate, and an
influence of the disconnection of the C_s line is taken into consideration when the above-
15 described quantity of charges is detected in a reading circuit. Note that the above-
described inspection is performed not for all the storage capacitors, but for one storage
capacitor in each C_s line. Thus, the inspection for all the C_s lines in liquid crystal
panels from 14 inch diagonal to 18 inch diagonal is terminated in about 1 to 2 seconds.
